The status output serves to display various alarm or error messages. In normal operation the status output is HIGH (open collector with int. pull-up 22 kOhm).		
An active status output (LOW) displays: LED fault (failure or ageing) – over-temperature – undervoltage In the SSI mode, the fault indication can only be reset by switching off the supply voltage to the device.

Signal level (+V = supply voltage)		HIGH	min. 60 % of +V, max: +V		
		LOW	max. 30 % of +V		
Input current		< 0.5 mA			
Min. pulse duration (SET)		10 ms			
Input delay		1 ms			
New position data readable after		1 ms			
Internal processing time		200 ms			
<p>The encoder can be set to zero at any position by means of a HIGH signal on the SET input. Other preset values can be factory-programmed. The SET input has a signal processing time of approx. 1 ms, after which the new position data can be read via SSI or BiSS. Once the SET function has been triggered, the encoder requires an internal processing time of typ. 200 ms; during this time the supply voltage must not be switched off.</p> <p>The SET function should be carried out whilst the encoder is at rest.</p> <p>If this input is not used, it should be connected to 0 V (Encoder ground GND) in order to avoid interferences.</p>					
DIR input					
<p>Direction input: A HIGH signal switches the direction of rotation from the default cw to ccw. This inverted function can also be factory-programmed. If DIR is changed when the device is already switched on, then this will be interpreted as an error. The status output will switch to LOW.</p> <p>If this input is not used, it should be connected to 0 V (Encoder ground GND) in order to avoid interferences.</p>					
Response time (DIR input)		1 ms			
Power-ON					
<p>After Power-ON the device requires a time of approx. 150 ms before valid data can be read.</p>					
<p>Hot plugging of the encoder should be avoided.</p>
